

SCOLIOSIS SCREENING

CATCH THE CURVE !

Children spend most of their awake moments in school with teachers hence what is not visible to the eye may be noticed by an astute teacher.

Hence “**School Scoliosis Screening**” programme assumes special importance, for early detection of Scoliosis and prevention of further deformity.

IN 85% of cases the cause of scoliosis is unknown (IDIOPATHIC) and remains undetected until it becomes severe and prominent

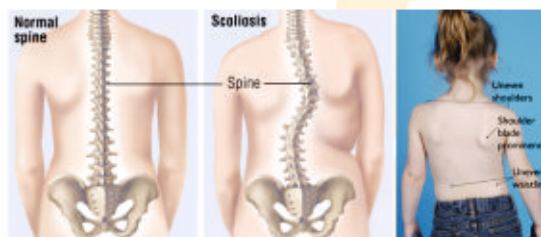

EARLY DETECTION CAN

- Help identify children with silent scoliosis.
- Arrest further progression.
- Help better growth of the child.
- Perhaps avoid surgery.

What is Scoliosis ?

Scoliosis is a condition in which the spine forms a sideways (lateral) abnormal curvature, due to twisting of spinal bones on each other

- Scoliosis may be from birth (congenital) or may happen in early childhood (4 to 18 years).
- Scoliosis causes abnormal bends to the right or left of spine like a 'C' or 'S' shape.

“ IS SCOLIOSIS REALLY A SILENT DEFORMITY ” ?.... NOT IF IT IS DETECTED EARLY !

If left undetected or untreated Scoliosis can increase the severity of spinal curvature and also give rise to medical problems in heart, lung, nerve and other organs of the body.
